Mercury Losses from the Chlor-Alkali Industry in 2003

**OSPAR Commission
2005**

The Convention for the Protection of the Marine Environment of the North-East Atlantic (the “OSPAR Convention”) was opened for signature at the Ministerial Meeting of the former Oslo and Paris Commissions in Paris on 22 September 1992. The Convention entered into force on 25 March 1998. It has been ratified by Belgium, Denmark, Finland, France, Germany, Iceland, Ireland, Luxembourg, Netherlands, Norway, Portugal, Sweden, Switzerland and the United Kingdom and approved by the European Community and Spain.

La Convention pour la protection du milieu marin de l'Atlantique du Nord-Est, dite Convention OSPAR, a été ouverte à la signature à la réunion ministérielle des anciennes Commissions d'Oslo et de Paris, à Paris le 22 septembre 1992. La Convention est entrée en vigueur le 25 mars 1998. La Convention a été ratifiée par l'Allemagne, la Belgique, le Danemark, la Finlande, la France, l'Irlande, l'Islande, le Luxembourg, la Norvège, les Pays-Bas, le Portugal, le Royaume-Uni de Grande Bretagne et d'Irlande du Nord, la Suède et la Suisse et approuvée par la Communauté européenne et l'Espagne.

Executive Summary/Récapitulatif

This report continues the series of reports on discharges, emissions and losses of mercury by all routes from mercury-cell chlor-alkali plants.

Le présent rapport prend la suite de la série de rapports sur les rejets, les émissions et les pertes de mercure empruntant toutes les voies de pénétration, provenant des installations d'électrolyse des chlorures alcalins à cellules de mercure.

After several years of more or less stable production capacities, mercury-cell based chlorine production capacities have decreased in the period 1998-2002, with a further small decrease from 2002 to 2003. Capacity reductions in Germany are mainly responsible for the decrease in 2003.

Après plusieurs années pendant lesquelles les capacités de production sont restées plus ou moins stables, les capacités de production du chlore basée sur des cellules au mercure ont baissé pendant la période de 1998 à 2002, et une nouvelle diminution de faible ampleur s'est manifestée de 2002 à 2003. Ce sont les baisses de capacité survenues en Allemagne qui sont pour l'essentiel à l'origine de la diminution intervenue en 2003.

Mercury losses through product, waste water and air have in total decreased 5% from 2002 to 2003.

Les pertes de mercure par le biais des produits, de l'eau usée et de l'atmosphère ont au total baissé de 5% de 2002 à 2003.

Over the years, atmospheric emissions of mercury have been significantly reduced. In 2003, there was a further slight reduction relative to emissions reported in 2002. The data show that all plants comply with the limit value for air emissions of 2 g mercury per tonne of chlorine produced (established by PARCOM Decision 90/3), and it is clear that in many plants, air emissions continue to fall.

Au fil des années, les émissions atmosphériques de mercure ont été sensiblement réduites. En 2003, on constate une nouvelle et légère baisse par rapport aux émissions signalées en 2002. Les données prouvent que toutes les installations respectent le plafond d'émission atmosphérique de 2 g de mercure par tonne de chlore produit (plafond fixé par la Décision PARCOM 90/3), et il est clair que dans de nombreuses installations, les émissions atmosphériques continuent de diminuer.

Between 2002 and 2003, the amount of mercury in safely deposited wastes has increased from about 70 tonnes to about 75 tonnes. Some countries report increases and others decreases but these changes do not necessarily correlate to the shutdown of cells or plants. OSPAR will in future seek more detailed information to explain year-to-year differences in the amount of mercury in safely deposited wastes.

Entre 2002 et 2003, la quantité de mercure dans les déchets mis en décharges sécurisées a augmenté, puisqu'elle est passée d'environ 70 à 75 tonnes à peu près. Certains pays signalent des augmentations tandis que d'autres indiquent des baisses, ces changements n'étant cependant pas nécessairement corrélés à la fermeture de cellules ou d'installations. Dans l'avenir, OSPAR demandera des renseignements plus détaillés afin de pouvoir expliquer les différences dans les quantités de mercure se trouvant dans les déchets mis en décharges sécurisées.

PARCOM Decision 90/3 contains a recommendation that existing mercury cell chlor-alkali plants be phased out as soon as practicable. The objective is that they should be phased out completely by 2010. Reports on the intended future phasing-out of national mercury-based chlor-alkali production capacities, previously included in this report, are now included in the "Overview Assessment of the Implementation of PARCOM Decision 90/3 on Reducing Atmospheric Emissions from Existing Chlor-Alkali Plants".

La Décision PARCOM 90/3 recommande que les installations existantes d'électrolyse des chlorures alcalins à cellules de mercure soient abandonnées le plus rapidement possible. L'objectif est qu'elles soient complètement abandonnées d'ici 2010. Les rapports relatifs aux projets d'abandon dans l'avenir des capacités nationales de production d'électrolyse des chlorures alcalins à cellules de mercure, qui étaient auparavant repris dans le présent rapport, figurent désormais dans la « Synthèse d'évaluation de la mise en œuvre de la Décision PARCOM 90/3 sur la réduction des émissions atmosphériques des installations existantes d'électrolyse des chlorures alcalins ».

1. Introduction

Since the beginning of the 1980s, mercury discharges, emissions and losses from the chlor-alkali industry have been addressed under the former Paris Commission (PARCOM). The following Decisions and Recommendations are applicable under the OSPAR Convention:

- PARCOM Decision on Limit Values for Mercury Emissions in Water from Existing and New Brine Recirculation Chlor-alkali Plants (exit of the purification plant), 1980;
- PARCOM Decision on Limit Values for Existing Waste Brine Chlor-Alkali Plants, 1981;
- PARCOM Decision on Limit Values for Existing Brine Recirculation Chlor-Alkali Plants (exit of the factory site), 1981;
- PARCOM Decision on New Chlor-Alkali Plants Using Mercury Cells, 1982;
- PARCOM Recommendation on Limit Values for Mercury Emissions in Water from Existing Brine Recirculation Chlor-Alkali Plants (exit of factory site), 1985;
- PARCOM Decision 90/3 on Reducing Atmospheric Emissions from Existing Chlor-Alkali Plants.

In 1983, Contracting Parties to the former Paris Convention initiated an annual reporting of mercury discharges, emissions and losses from their national chlor-alkali industry. These data were compiled by the OSPAR Secretariat and, following examination by the relevant subsidiary bodies, published by the Commission in form of Annual Reports on Mercury Losses from the Chlor-alkali Industry, which comprised yearly data series from 1982 onwards.

Over time, reporting requirements and formats were regularly reviewed and up-dated in the light of the ongoing work under the Commission as regards the chlor-alkali industry. With a view to harmonising the way in which data and information are being established and reported, the Hazardous Substances Committee (HSC) of the OSPAR Commission adopted in 2003 the current reporting formats and procedures (see OSPAR agreement; reference number 2003-5) which set out the requirements for data and information to be provided via Euro Chlor. Annual data on discharges, emissions and losses of mercury from each plant operating within OSPAR Contracting Parties are reported to the OSPAR Secretariat, which, following a check and confirmation by Contracting Parties, compiles these technical data in form of a report.

OSPAR acknowledges the assistance of Euro Chlor in assembling the information and appreciates the efforts made by Euro Chlor to provide all requested information on a plant-by-plant basis and recommends continuing this procedure in future.

2. Assessment of the Report on mercury losses from the Chlor-Alkali industry in 2003

On the basis of data provided by EuroChlor and all Contracting Parties, the following points are important to note:

- a. as already stated for the year 2002, the mercury-cell-based chlorine production capacities have generally stayed the same with a small decrease from 2002 to 2003. The production capacity of all installations in the Convention area and for installations in the drainage area to maritime area decreased about 161 kilo tonnes. These reductions are based on the shut down of one plant in Germany (D/4) and of one plant in Spain (E/2), which was partly converted to membrane technology.
- b. "Mercury Losses through Product, Waste Water and Air" have decreased about 5% from 2002 to 2003. For the total decrease of about 255 kg from 2002 to 2003 the following Contracting Parties were mainly responsible: Germany with 192 kg and Spain with 38 kg. Some other countries had important increases e.g. France (116 kg), Belgium (34 kg) and UK (35 kg). The data show that there is still a wide range of specific Mercury Losses through Product, Waste Water and Air (from 0.22 to 1.68 g per tonne);
- c. air emissions of mercury have been slightly reduced in 2003. Significant reductions are reported from Germany (187 kg) and from UK and Switzerland of about 11 and 10 kg respectively. An increase of emission was reported by France, where one plant (F/7) increased its specific and total emissions up to 150 %. For further countries slight increases are indicated, e.g. Belgium and the Netherlands.

All plants comply with the limit value of 2 g Hg/t Cl₂ for air emissions in PARCOM Decision 90/3, and it is clear that in many plants, air emissions continue to fall. However, according to the data in Table 5 a wide range in actual values from 0.14 to 1.57 g Hg/t Cl₂ is shown. The extent to which these values are considered to reflect BAT in general or only for individual plants concerned is not clear. However, the EC Reference Document on Best Available Techniques in the Chlor-Alkali Industry (December 2001) identified techniques used in the best performing mercury-based chlor-alkali plants, which achieve losses to air, water and with products in the range of 0.2-0.5 g Hg/t Cl₂ specified in PARCOM Decision 90/3;

- d. over the last year (see Table 6), the amount of mercury in safely deposited wastes has increased from about 70 tonnes to about 75 tonnes. The data are variable however, with some countries showing decreases and some showing increases. For example in 2003, Germany has a total value of about 35 tonnes and UK of about 21 tonnes. There is an explanation in Tables 6 and 7 what "safely deposited wastes" constitutes, as the range of values is extremely large, because all deposits of mercury in whatever concentrations should be accounted for. For example, the increase or decrease does not necessarily correlate to the shutdown of cells or plants all over the countries. The increasing figures of some plants e.g. in Germany plants D/5, D/8 or for UK plant UK/3 do not correspond to any changes in capacity or conversion activities and it can not be explained by changes of capacity or conversion activities. So it would be helpful in future to have more detailed information in this table to explain year to year differences, and whether these are due to pure mercury from decommissioned cells being returned to the market or used in other plants, or for other reasons.

Reports on the intended future phasing-out of their national mercury-based chlor-alkali production capacities have previously been included in this report. The national plans on future phasing-out mercury-based chlor-alkali production capacities are now summarised in document "Overview Assessment of Implementation of PARCOM Decision 90/3 on Reducing Atmospheric Emissions from Existing Chlor-Alkali Plants" and readers are referred to this document which can be found at the OSPAR website under "hazardous substances/implementation reports and implementation reporting formats" (www.ospar.org) for further information.

Altogether the reported figures show clearly the results of the efforts, which have been achieved during the last five years. While the chlorine production capacity was reduced from 1998 to 2003 to about 78 % of the capacity in 1998, the parameter "mercury losses through product, waste water and air" and the parameter "atmospheric emissions of mercury" were reduced in a more forced rate to about 60 %.

3. Evolution of mercury losses from the chlor-alkali industry (1982-2003)

The following figures give a rough indication of the evolution of mercury losses from the chlor-alkali industry in the period 1982-2003 as follows:

- Figure 1: Chlorine Production Capacity with Mercury Cells;
Figure 2: Mercury Losses through Product, Waste Water and Air;
Figure 3: Atmospheric Emissions of Mercury.

It should be noted that these figures use data from previously published OSPAR Reports and that the way in which these data, in particular the pre-1999 data, were calculated and reported might differ:

- from Contracting Party to Contracting Party;
- within a time series of one Contracting Party.

Therefore, the interpretation of the figures is limited and any comparisons have to be carried out with extreme caution.

It should also be noted that Finland and Switzerland were not Contracting Parties to the former Paris Convention. Prior to the entry into force of the OSPAR Convention, the Contracting Parties supplied data on a voluntary basis as follows:

- Finland from 1996 onwards, atmospheric emissions from the only mercury-based chlor-alkali plant, which discharges into the Baltic Sea (i.e. outside the OSPAR maritime area);

Switzerland from 1993 onwards, full data sets for the national mercury-based and mercury-free chlor-alkali industry.

Some information about changes in the reporting over time, as well as explanations of considerable increases or decreases in values, are given in footnotes to the OSPAR Report on Mercury Losses from the Chlor-alkali Industry (1982-1998), which was published in 2000.

A further source of information to be taken into account are the expert assessments, which were included in the publication of the Annual OSPAR Reports on Mercury Losses from the Chlor-alkali Industry from 1996 onwards.

Until 2003, data has been published in Figures 1 to 3 as total figures for each Contracting Party. Since 1998, data has been made available on a plant-by-plant basis¹. In order to improve comparability of performance, plant-by-plant data are now published in:

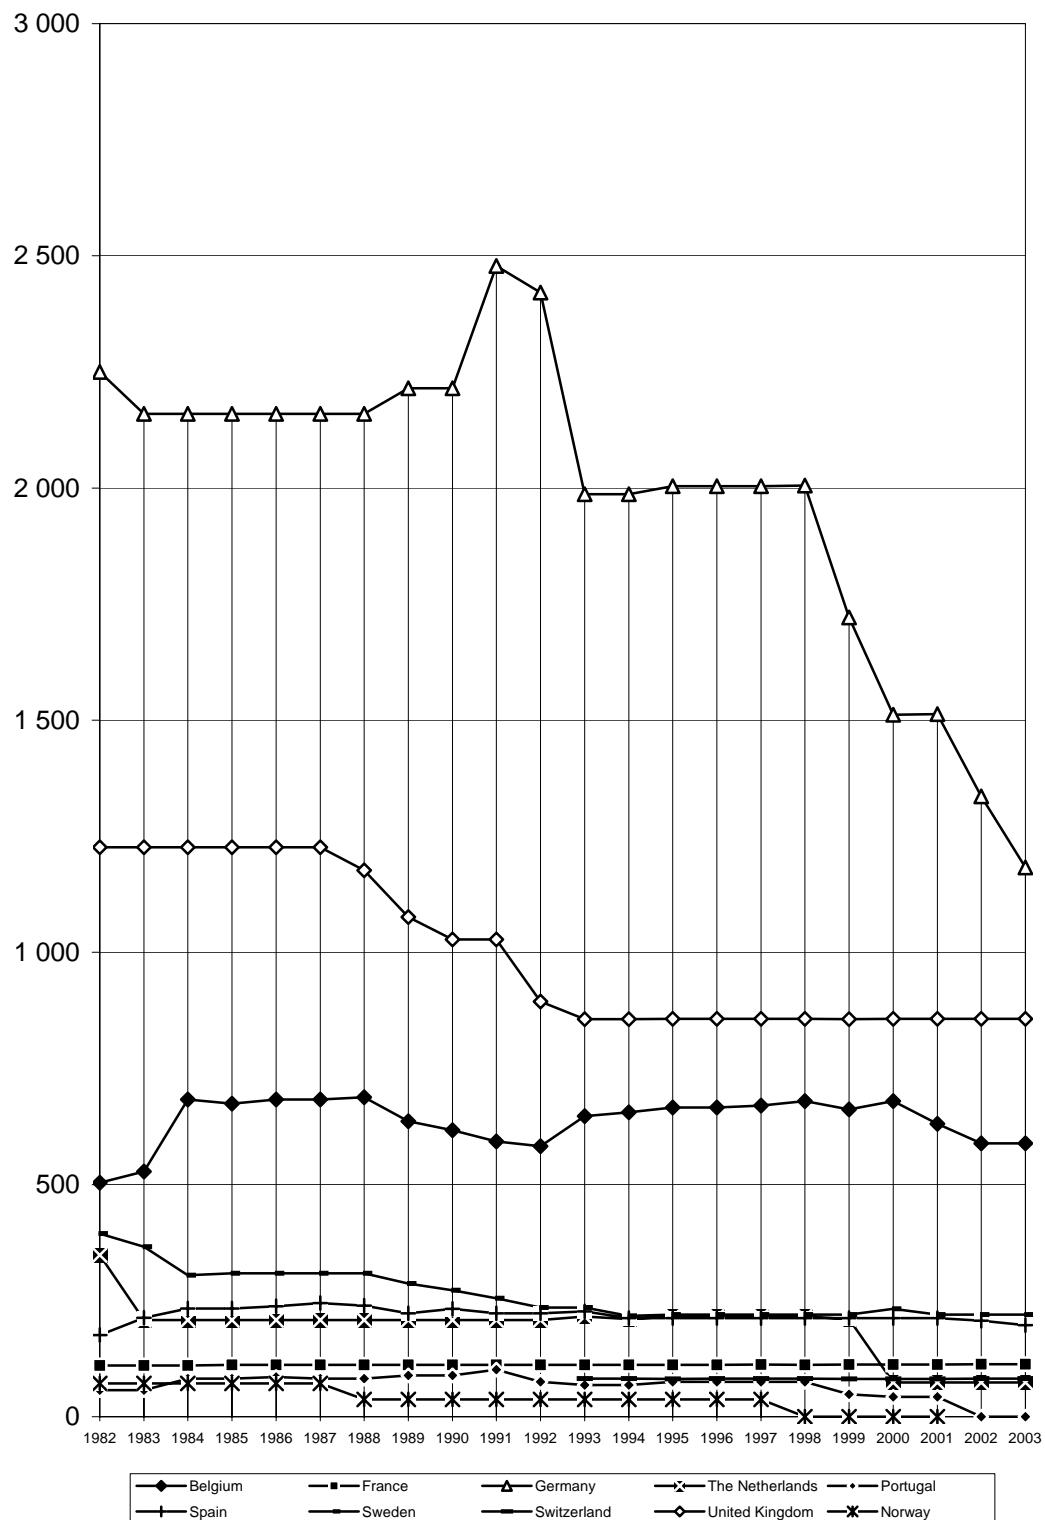

- Table 1: Chlorine Production Capacity with Hg-cells (tonnes)
- Table 2: Mercury Losses through Product, Waste Water and Air (kg per year)
- Table 3: Mercury Losses through Product, Waste Water and Air (g per tonne production capacity)
- Table 4: Atmospheric Emissions of Mercury (kg per year)
- Table 5: Atmospheric Emissions of Mercury (g per tonne production capacity)
- Table 6: Mercury in Safely Deposited Wastes (kg per year)
- Table 7: Mercury in Safely Deposited Wastes (g per tonne production capacity)

The presentation of these figures since 1998 will also assist in:

- a. the review of progress to moving towards the OSPAR 2020 target of the cessation of discharges, emissions and losses of mercury;
- b. the assessment of the effectiveness of the implementation of PARCOM Decision 90/3.

To this end, all locations of mercury-based chlor-alkali plants in operation in 1998 are described in Section 4.2 including when they have been decommissioned or converted.

¹ For plant codes in the tables see section 4.1.

* All mercury-contaminated materials, such as cell components, process equipment, solid wastes from sumps, pits, demercurisation units and the brine purification process, which have been sent to authorised and properly controlled toxic waste disposal sites, are to be included in the category "safely deposited waste". For the purpose of the balance, all deposits of mercury in whatever concentrations should be accounted for.

*OSPAR Commission, 2005:
Mercury losses from the chlor-alkali industry (1982-2003)*

* All mercury-contaminated materials, such as cell components, process equipment, solid wastes from sumps, pits, demercurisation units and the brine purification process, which have been sent to authorised and properly controlled toxic waste disposal sites, are to be included in the category "safely deposited waste". For the purpose of the balance, all deposits of mercury in whatever concentrations should be accounted for.

*OSPAR Commission, 2005:
Mercury losses from the chlor-alkali industry (1982-2003)*

4. 2002 data and information

4.1 Introduction

In this part of the report, data and information about the national chlor-alkali industry of each OSPAR Contracting Party is given as follows:

- a. Contracting Parties with mercury-based chlor-alkali plants:
 - (i) two overview maps showing the locations, the names and the operators of the sites;
 - (ii) tables with technical data on the annual discharges, emissions and losses, including wastes, from plants of each Contracting Party (provided via Euro Chlor);
- b. Contracting Parties with mercury-free plants or without chlor-alkali industry.

The column headings and abbreviations (e.g. C, E1, E2 etc) used in the tables correspond to the reporting requirements set out in the current formats:

Sea Area - Sea area in which liquid wastes from the plant is discharged, or is likely to be discharged

OSPAR maritime area

A - Atlantic

Areas not covered by the OSPAR Convention

Baltic - Baltic Sea

BI Sea - Black Sea

M - Mediterranean Sea

Brine W - waste brine plant

R - brine-recirculation plant

Values are expressed in continental notation.

4.2 Locations of mercury-based chlor-alkali plants

The two following maps give an overview of the locations of the mercury-based chlor-alkali plants indicated below and their operators:

Country/Code	Company	Location	Status
Belgium			
B/1	Solvin	Lillo	
B/2	Tessenderlo	Tessenderlo	
B/3	Solvin	Antwerpen	
B/4	Solvay	Jemeppe	Replaced its mercury technology in 2001
Finland			
SF/1	Eka Chemicals	Oulu	The permitted discharges and emissions have been increased on the basis of a revised authorisation in 2002
France			
F/1	PC de Loos	Loos	
F/2	Albemarle PPC	Thann	
F/3	Solvay	Tavaux	
F/4	Atofina	Jarrie	
F/5	SPC Harbonnières	Harbonnières	
F/6	Atofina	Lavera	
F/7	Atofina	St Auban	
Germany²			
D/1	ECI	Bitterfeld	Ceased operation in 1999
D/2	Bayer	Uerdingen	Converted to membrane
D/3	ECI	Ibbenbüren	
D/4	Bayer	Leverkusen	Shut down in 2002
D/5	BASF	Ludwigshafen	
D/6	Ineos	Wilhelmshafen	
D/7	Vestolit	Marl	Shut down of some cells in 2001
D/8	Degussa - Hüls	Lülsdorf	
D/9	Lil	Frankfurt	The permitted discharges and emissions have been increased on the basis of a revised authorisation in 2001
D/10	Bayer	Dormagen	Ceased operation in 1999
D/11	Clariant	Gersthofen	Shut down in 2000
D/12	Wacker Chemie	Burghausen	Shut down in 2000
D/13	Vintron	Knapsack	
D/14	Vinnolit	Gendorf	
D/15	BSL Olefinverbund	Schkopau	Shut down in 1998
The Netherlands			
NL/1	Akzo Nobel	Hengelo	
NL/2	Solvay	Linne-Herten	Decommissioned in 1999
Portugal			
P/1	Uniteca	Estarreja	Has been replaced by membrane cells in January 2002
P/2	Solvay Portugal	Póvoa de Santa Iria	Shut down in 1998

² Germany advised that 7 plants have been converted. 5 more plants are to be converted.

Country/Code	Company	Location	Status
Spain			
E/1	Quimica del Cinca	Monzon	
E/2	Electroquimica de Hernani	Hernani	Partly converted to membrane technology
E/3	Elnosa	Lourizan	
E/4	Ercros	Flix	
E/5	Solvay	Torrelavega	
E/6	Solvay	Martorell	
E/7	Aragonesas	Sabinanigo	
E/8	Aragonesas	Vilaseca	
E/9	Aragonesas	Huelva/Palos	
Sweden			
S/1	Akzo Nobel	Bohus	
S/2	Hydro Polymers	Stenungsund	Verified value
Switzerland			
CH/1	Solvay	Zurzach	
CH/2	Syngenia	Monthey	
CH/3	SF-Chem	Pratteln	
United Kingdom			
UK/1	Rhodia	Staveley	
UK/2	Albion Chemicals	Sandbach	
UK/3	Ineos	Runcorn	

4.3 Other OSPAR Contracting Parties

Denmark

Denmark has no chlor-alkali plants.

Luxembourg

Luxembourg has no chlor-alkali plants.

Iceland

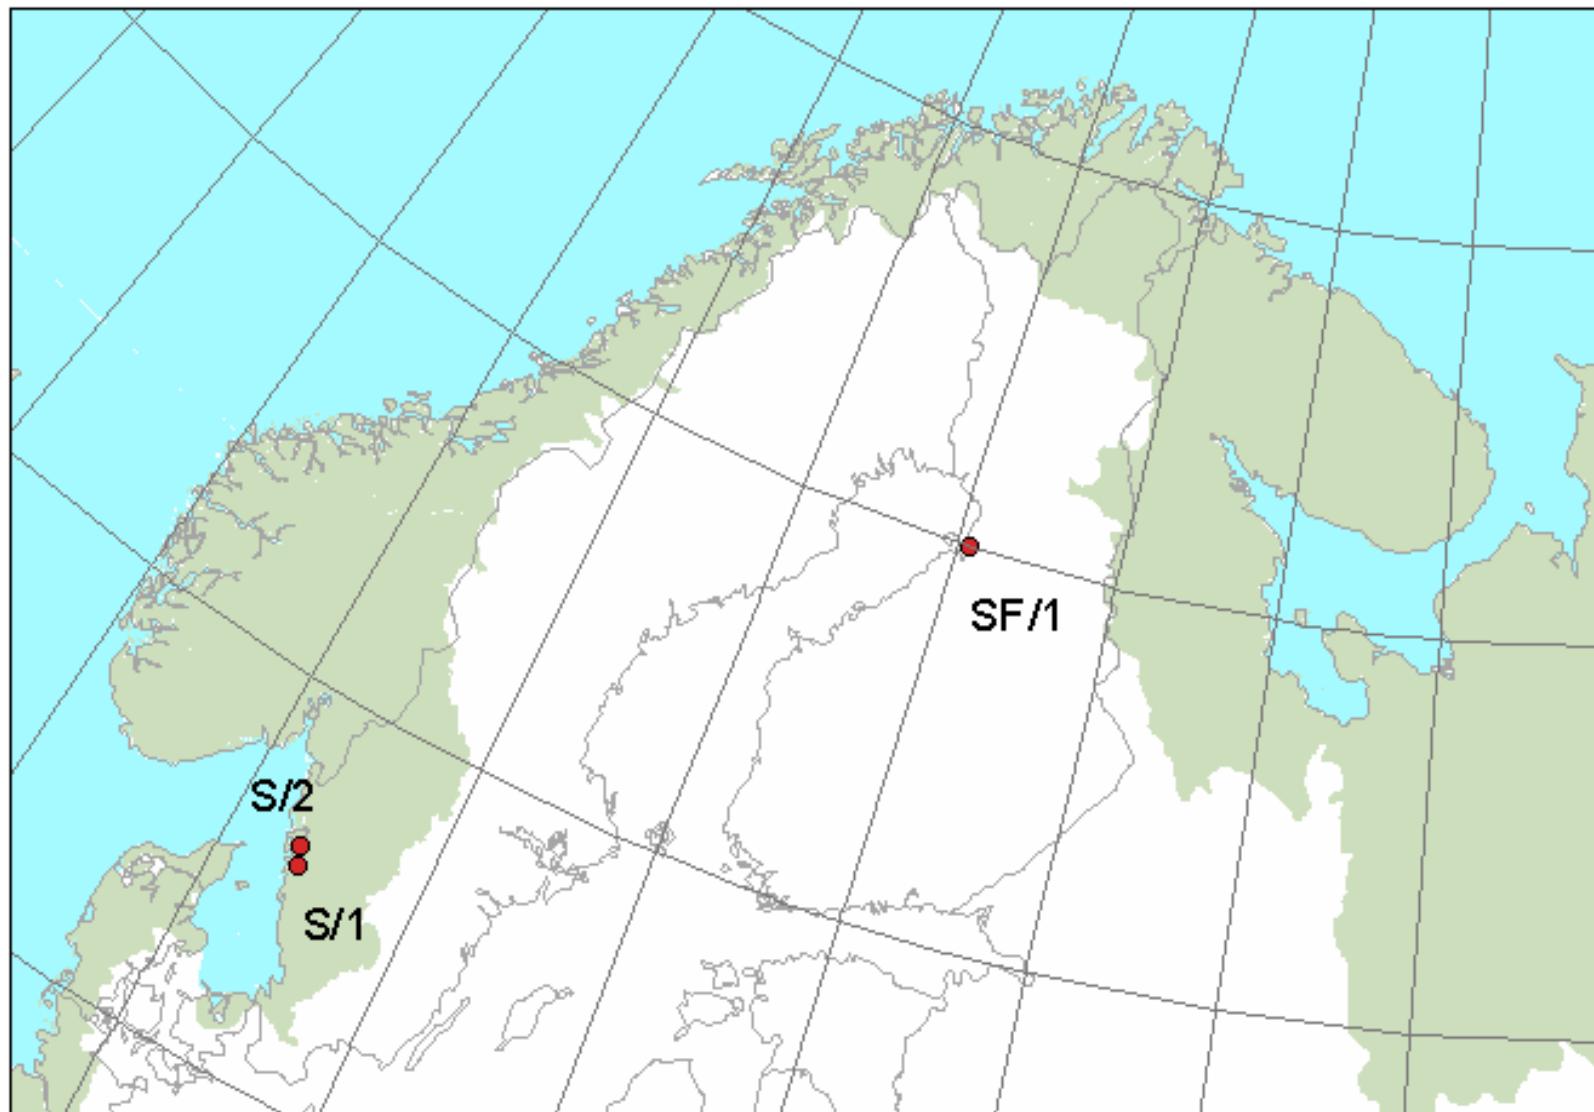

Iceland has no chlor-alkali plants.

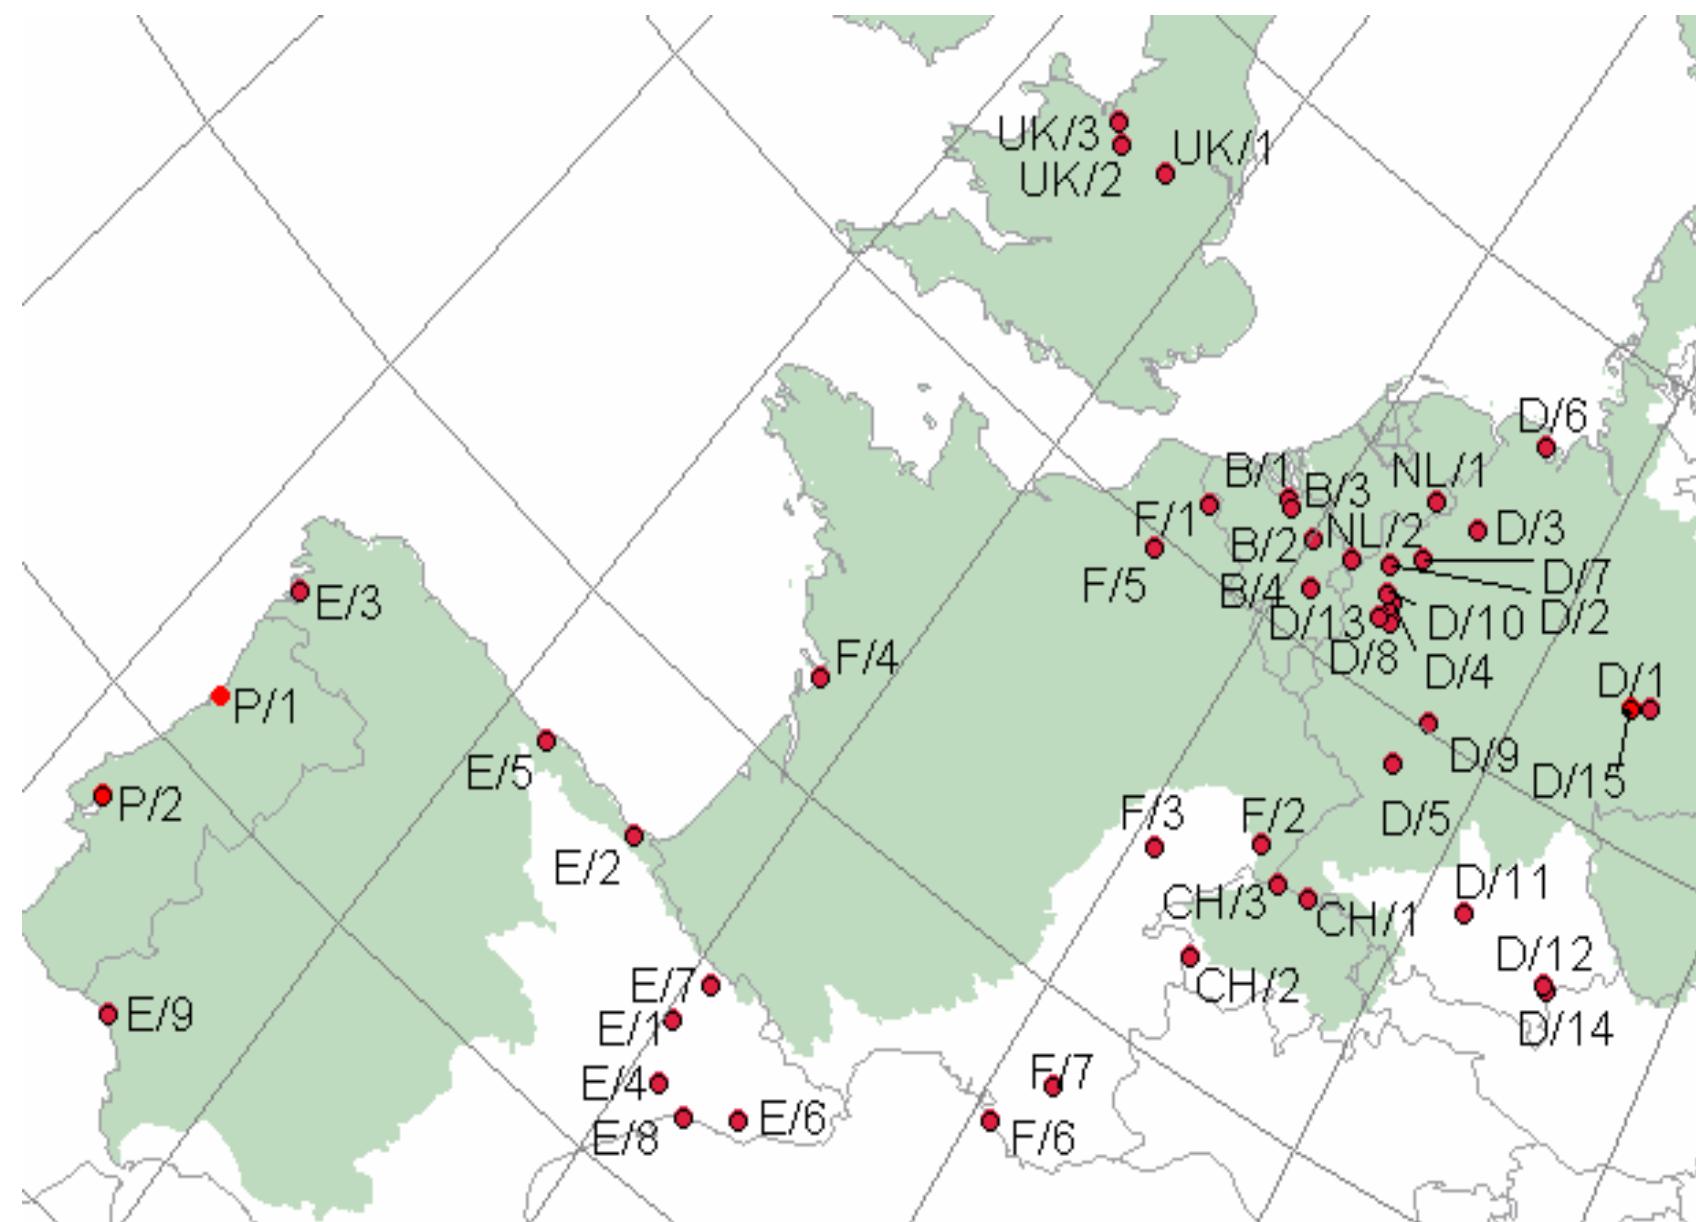

Ireland

Ireland has only one chlor-alkali plant, which operates mercury-free.

Norway

The last Norwegian plant with mercury cells ceased its mercury-based operations in September 1997.

Belgium
