

Comprehensive Atmospheric Monitoring Programme

**Deposition of air pollutants around the
North Sea and the North-East Atlantic
in 2009**

OSPAR Convention

The Convention for the Protection of the Marine Environment of the North-East Atlantic (the “OSPAR Convention”) was opened for signature at the Ministerial Meeting of the former Oslo and Paris Commissions in Paris on 22 September 1992. The Convention entered into force on 25 March 1998. It has been ratified by Belgium, Denmark, Finland, France, Germany, Iceland, Ireland, Luxembourg, Netherlands, Norway, Portugal, Sweden, Switzerland and the United Kingdom and approved by the European Union and Spain.

Convention OSPAR

La Convention pour la protection du milieu marin de l'Atlantique du Nord-Est, dite Convention OSPAR, a été ouverte à la signature à la réunion ministérielle des anciennes Commissions d'Oslo et de Paris, à Paris le 22 septembre 1992. La Convention est entrée en vigueur le 25 mars 1998. La Convention a été ratifiée par l'Allemagne, la Belgique, le Danemark, la Finlande, la France, l'Irlande, l'Islande, le Luxembourg, la Norvège, les Pays-Bas, le Portugal, le Royaume-Uni de Grande Bretagne et d'Irlande du Nord, la Suède et la Suisse et approuvée par l'Union européenne et l'Espagne.

Acknowledgement

This report has been prepared by Alice Newton with help from Wenche Aas, Anne-Gunn Hjellbrekke, and Mona Waagsbø, from the Norwegian Institute for Air Research (NILU), and Damian Icely. Thanks go also to helpful suggestions from the national experts of the OSPAR INPUT Working Group and Andrea Weiss of OSPAR Secretariat. Their ideas and comments served to enrich the report.

Executive summary

This report presents the results of monitoring undertaken by OSPAR Contracting Parties for the Comprehensive Atmospheric Monitoring Programme (CAMP) during 2009. Under the CAMP, OSPAR Contracting Parties are committed to monitoring, on a mandatory basis, the concentrations of a range of metals, organic compounds and nutrients in precipitation and air, and their depositions. The CAMP also encourages OSPAR Contracting Parties to monitor, on a voluntary basis, additional compounds (such as certain persistent organic pollutants). The report gives detailed information on observed atmospheric inputs of selected contaminants to the OSPAR maritime area and its regions during 2009.

There were few changes in the CAMP reporting for 2009. Several of the stations do not strictly meet the requirements of the CAMP Principles (e.g. distance from the coast). Region II, the North Sea, remains the most intensely observed sub-region. Sub-regional coasts that are most underrepresented are the Irish Sea (Region III), the Bay of Biscay (Region IV), and the far north-east (Region I).

The trend towards more complete and more timely reporting remains positive, however, certain elements regularly go unreported. The programme for observation of airborne concentrations of pollutants is least observed, and for the programme for pollutants in precipitation, lindane and mercury receive least attention. Lack of reporting stations hinders interpretation of monitored data especially for lindane and mercury. Monitoring results show high concentrations of mercury in Nordic countries and underline the importance of monitoring in Region I. Data on PCBs is also very limited which limits interpretation.

Récapitulatif

Ce rapport présente les résultats de la surveillance continue mise en œuvre par les parties contractantes à OSPAR dans le cadre du Programme exhaustif de surveillance continue de l'atmosphère (CAMP) en 2009. Aux termes du programme CAMP, les parties contractantes à OSPAR s'engagent à mettre en œuvre une surveillance continue obligatoire des concentrations d'un ensemble de métaux, de composés organiques et de nutriments dans les précipitations et dans l'atmosphère, ainsi que de leurs dépôts. Le programme CAMP encourage aussi les parties contractantes à OSPAR à pratiquer une surveillance continue, sur la base du volontariat, de composés supplémentaires (tels que certains polluants organiques persistants). Le rapport présente des informations détaillées sur les apports atmosphériques observés de certains contaminants dans la zone maritime OSPAR et dans ses régions en 2009.

On a observé peu de changements de la notification dans le cadre du Programme CAMP pour 2009. Plusieurs stations ne satisfont pas rigoureusement aux conditions énoncées dans les Principes CAMP (par exemple la distance à partir du littoral). La Région II, c'est-à-dire la mer du Nord, reste la sous-région la plus intensément observée. Les littoraux sous-régionaux les plus sous-représentés sont la mer d'Irlande (Région III), la Baie de Biscay (Région IV) et l'extrême nord-est (Région I).

La tendance vers une notification plus complète, réalisée dans de meilleurs délais, reste positive, malgré cela certains éléments sont régulièrement omis par la notification. Le programme d'observation des concentrations atmosphériques de polluants est celui qui est le moins observé, et en ce qui concerne le programme d'observation des polluants dans les précipitations, on fait le moins attention au lindane et au mercure. Le manque de stations disponibles pour la notification entrave l'interprétation des données de surveillance, surtout pour le lindane et le mercure. Les résultats de la surveillance indiquent des concentrations élevées de mercure dans les pays nordiques et soulignent l'importance de la surveillance dans la Région I. Les données sur les polychlorobiphényles sont également très limitées, ce qui restreint leur interprétation.

Deposition of air pollutants around the North Sea and North-East Atlantic in 2009

1. Introduction

This report collates and describes the observations from coastal monitoring stations across the OSPAR region (see Figure 1.1) under the Comprehensive Atmospheric Monitoring Programme (CAMP), this forming one element within the wider Joint Assessment and Monitoring Programme of OSPAR. The CAMP aims to assess, as accurately as appropriate, the atmospheric input of the selected contaminants to the maritime area and regions thereof (Figure 1.1) on an annual basis through monitoring the concentrations of selected contaminants in precipitation and air, and determining their deposition. The monitoring regime employed is set out in the CAMP Principles (OSPAR reference number: 2001-7), describing the relevant substances, sampling approach, locations and frequency, and assessment methodologies. The approach used in this report moves **towards an indicator based assessment**, using a colour code scale indicating the relative magnitudes of pollutant deposition.

Figure 1.1: OSPAR maritime area and Regions. Region I: Arctic Waters, II: Greater North Sea, III: Celtic Seas, IV: Bay of Biscay/Iberian Coast, V: Wider Atlantic

The components of interest to the CAMP are divided into two groups, for measurement on a mandatory basis and for measurement on a voluntary basis. These are listed in Table 1.1.

Table 1.1: Components to be measured under the CAMP

	Mandatory	Voluntary
Precipitation	As, Cd, Cr, Cu, Pb, Hg, Ni, Zn, γ -HCH, NH_4^+ , NO_3^-	PCB 28,52,101,118,138,153,180 PAHs: Phenanthrene, anthracene, fluoranthene, pyrene, benzo(a)anthracene, chrysene, benzo(a)pyrene, benzo(ghi)perylene, indeno(1,2,3-cd)pyrene
Airborne	NO_2 , HNO_3 , NH_3 , NH_4^{+a} , NO_3^{-a}	As, Cd, Cr, Cu, Pb, Hg, Ni, Zn, γ -HCH, PCB 28,52,101,118,138,153,180, PAHs: Phenanthrene, anthracene, fluoranthene, pyrene, benzo(a)anthracene, chrysene, benzo(a)pyrene, benzo(ghi)perylene, indeno(1,2,3-cd)pyrene, NO

^{a)} total ammonium ($\text{NH}_3 + \text{NH}_4^+$) and total nitrate ($\text{HNO}_3 + \text{NO}_3^-$) is an alternative

The CAMP Principles call for each Contracting Party bordering the OSPAR maritime area (excluding the EU) to operate at least one monitoring station on the coast and/or offshore as part of the CAMP. Where Parties border more than one region (see Figure 1.1) at least one station should be operating in each. The stations should be so-called “background stations”, i.e. not directly influenced by local emission sources. The stations should be located not more than 10 km from the coastline.

The data assembled by monitoring stations are reported by Contracting Parties to the Norwegian Institute for Air Research (NILU) on a yearly basis, using a reporting format and according to the time schedule set out in the CAMP Principles. Based on the data received, NILU prepares a CAMP data report on an annual basis for OSPAR.

The present CAMP data report “*Pollutant depositions in the OSPAR region of the North-East Atlantic in 2009*” gives in Chapter 2 an overview of reported data and the implementation of the CAMP Principles in 2009. The overview includes the geographical coverage, the coverage by each Contracting Party of contaminants subject to mandatory and voluntary monitoring, the timeliness of data submission, and the reporting of additional components. In Chapter 3, the 2009 observed annual depositions of components subject to mandatory monitoring are mapped. A relative colour scale is also used as a step towards an indicator based assessment. Chapter 4 provides overviews of temporal patterns in the observations in recent years and introduces the use of a colour scale for temporal trends. Chapter 5 summarises the main points on the reported CAMP data for 2009 and includes suggestions for improving the CAMP programme. The data submitted by Contracting Parties as monthly values are appended to this report (see Annex).

2. The OSPAR CAMP Monitoring Programme in 2009

2.1 Geographical coverage

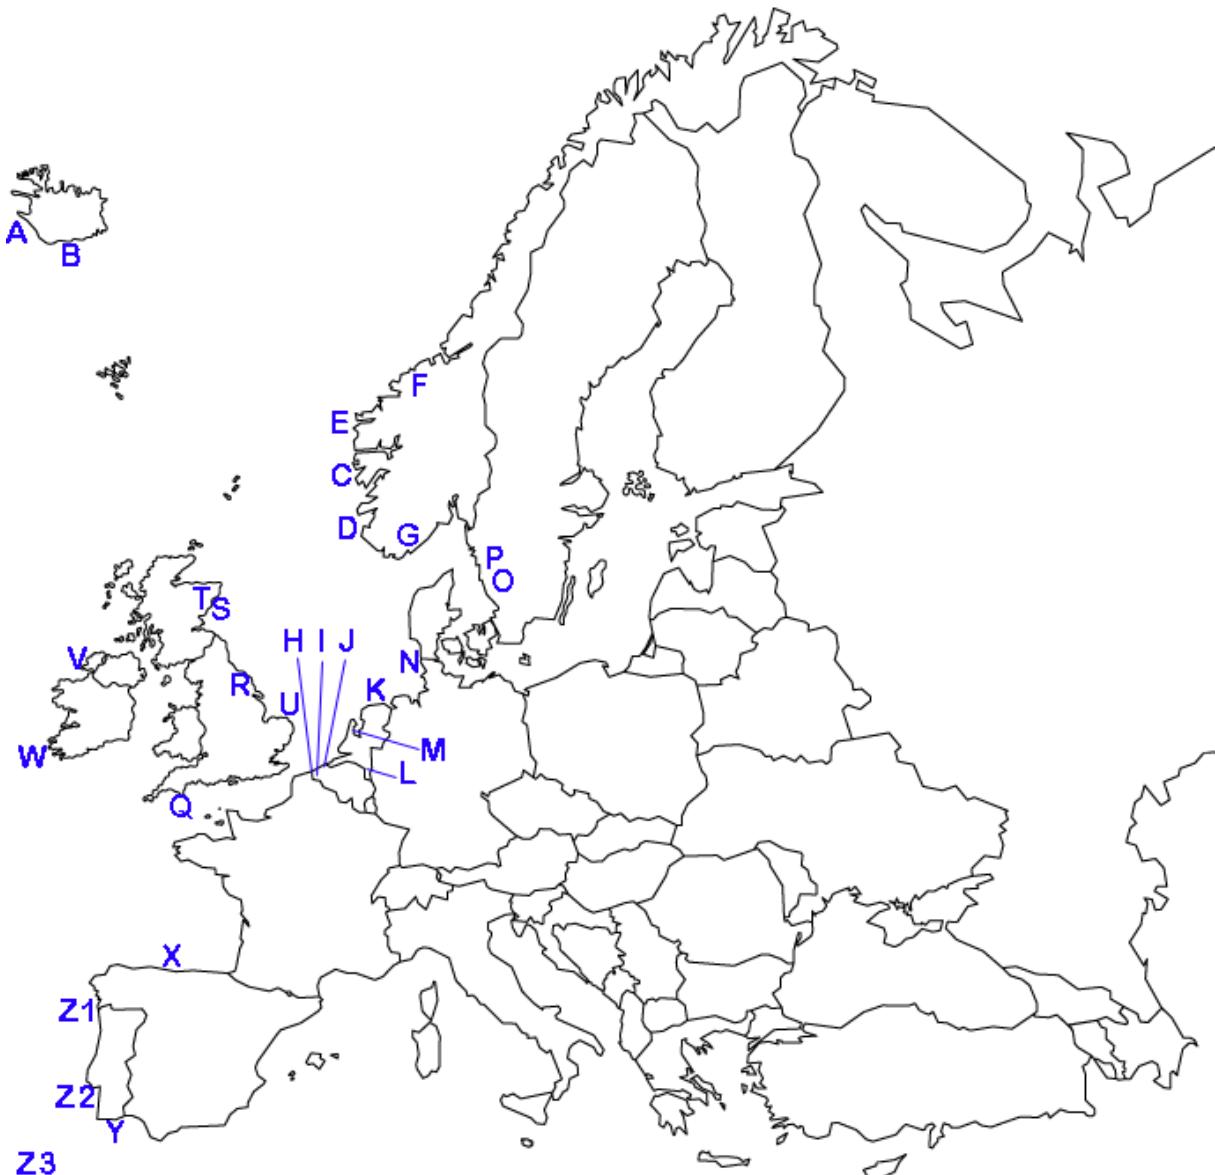

Figure 2.1: Monitoring sites reporting to OSPAR in 2009

Letters are substituted for the Station numbers for clarity and shown in Table 2.1

The reporting network during 2009 changed slightly, and there were some changes in which components were observed at each station. Despite the mandatory label applied to the first column of components in Table 1.1, not all stations reported data for all components, as commented in section 2.2.

2.2 Completion of the observation programmes

The Comprehensive Atmospheric Monitoring Programme (CAMP) provides ground truth data on atmospheric pollution of OSPAR waters in a coordinated manner. Ten Parties participated in the 2009 programme, see Table 2.2. France and Denmark had not reported the mandatory data by the end of 2010 and the data are therefore not included in this report. Data from Portugal was not complete by the end of 2010 and so only part of the data from Portugal is included. Some countries also delivered data for many additional components that are not listed by CAMP. Implementation of the mandatory programme for airborne pollutants is varied. The least reported mandatory contaminants in precipitation are mercury and lindane, two important pollutants.

From the combined numbers of Contracting Parties and of pollutants, the percentage data delivery for the mandatory contaminant monitoring can be determined, based on the assumption that full completion of the programme would be represented by delivery of 12 monthly averages which pass quality control criteria for each of the listed components. The mandatory programme for components in precipitation, for example, contains 11 substances and that for airborne concentrations contains at least 3 substances, so that 14×12 month averages successfully meeting quality control criteria would be needed to achieve 100% delivery. Reported values which are insufficient to calculate monthly averages are not taken into account. Fulfilment of the CAMP 2009 mandatory programme is shown in Figure 2.2.

Figure 2.2: Completion of the Mandatory Programmes 2009 (100% = 12 months x 14 values)

2.3 Timeliness of reporting

Initially, reporting of observation data for 2009 was somewhat delayed, the process beginning with a delayed data request by NILU. There were further delays before the issuing of Quality Control data checks by NILU, and thus the process has been running late. The data check round has been slower, although for many Contracting Parties this is usually dictated by external factors.

Table 2.3: Timetable for data reporting according to the CAMP Principles. There were departures from this timetable both in the timeliness of the reporting and the data processing

30 th June	Call for metadata and data issued from NILU (regarding new data and metadata), with instructions and reference to supporting software (e.g. where to find tools on the NILU website).
30 th September	Participants submit data and metadata via email or on diskette, in specified formats.
31 st October	NILU returns data and metadata via email or on diskette in the form of a 'validation report' to data originators for verification and signing off by the data originators within two weeks of reception.

2.4 Reporting of additional components

Parties report a wider range of components than is covered by CAMP. All the components reported by Contracting Parties during 2009 are listed in the Annexes. These cover the mandatory components, the voluntary components, and additional components.

The main body of this report is a description of observations of the mandatory components alone. These are shown as maps and on a relative colour bar scale using the same colours as the maps. Excluded are only the major ions which are reported solely to provide the potential for quality control, and compounds which are a part of other international programmes, but which may be expected to lie outside the core interest of OSPAR, e.g. sulphates, ozone, PM measurements.

Values such as -9999.999 and some integers are flags that denote various problems in the data, such as no data, no precipitation data or detection limit problems.

3. Observed pollutant depositions at monitoring stations in 2009

This section describes relative air pollutant status at coastal stations around the North-East Atlantic in 2009. The annual average concentrations of contaminants subject to mandatory monitoring are listed and mapped. Metal concentrations and depositions in precipitation are presented in Figures 3.2-3.8. Data for mercury is shown in Figure 3.9, and lindane in Figure 3.10. Nitrogen concentrations and depositions in precipitation are mapped in Figures 3.11 and 3.12. In all figures, Portuguese data from the Azores is located below the relative colour scale. Colour coding in pink on the maps means no data. Table 3.1 gives an overview of the colour coding used in section 3 and 4 of this report.

Table 3.1: Overview of relative scale and colour coding used in maps and tables in sections 3 and 4

As µg/m ²	Cd µg/m ²	Cr µg/m ²	Cu µg/m ²	Pb µg/m ²	Hg µg/m ²	Ni µg/m ²	Zn µg/m ²	γ-HCH ng/m ²	NH ₄ , NO ₃ mg N/m ²
> 500	> 50	> 500	> 2500	> 1250	> 10000	> 650	> 10000	> 2500	> 500

300-400	30-40	300-400	1500-2000	750-1250	7500-10000	350-500	5000-7500	250-1000	300-400
200-300	20-30	200-300	1000-1500	500-750	5000-7500	250-350	2500-5000	100-250	200-300
100-200	10-20	100-200	500-1000	250-500	2500-5000	100-250	1250-2500	25-100	100-200
< 100	< 10	< 100	< 500	< 250	< 2500	< 100	< 1250	< 25	< 100
No data	No data								

It is important to note that different precipitation amounts are used for the calculation of the different components. These are: major ions; POPs; mercury; and other metals. The different precipitation amounts correspond to the different instruments used for the different components.

3.1 Overview of coastal deposition of metals

Table 3.2 uses a colour code, which is the same as on the maps for the individual pollutants below (see Table 3.1 for scales and colour coding), to indicate the relative deposition of the metals at each station. It allows a rapid comparison of the sites based on the observations of metals. It also allows us to compare the metals and visualize which still have relatively high depositions. The colour code indicates the relative scale deposition on a low (blue) to high (red), similar but without the same interpretation as in the Water Framework Directive. So red does not indicate poor status, rather a relatively high deposition of the component. Pink indicates no data.

Table 3.2: Relative annual depositions of metals in precipitation 2009

Table 3.2 shows that relative deposition of metals is low at Station PT0002R but relatively high at Station IE0001R. It also shows that deposition of Arsenic (As) is generally low.

Of the mandatory substances, the metals excluding mercury have been reported by most Contracting Parties. The depositions of these components in precipitation around the coasts of the OSPAR area can be summarised in terms of their highest and lowest values. In Figure 3.1 this has been done using a radial graph. In this example, the mean deposition value has been calculated for each metal. This has then been plotted on a radial graph, where low values are close to the centre and shown as blue, whereas very high values are shown as off target and red. The colour codes are the same as those used in the maps (see Table 3.1 for relative scales and colour coding). In the example, arsenic deposition is generally low, whereas copper, zinc and mercury are generally high. Of course, this may be due to one or two very high values. These radial diagrams may be useful for OSPAR and could be broken down into the different OSPAR regions.

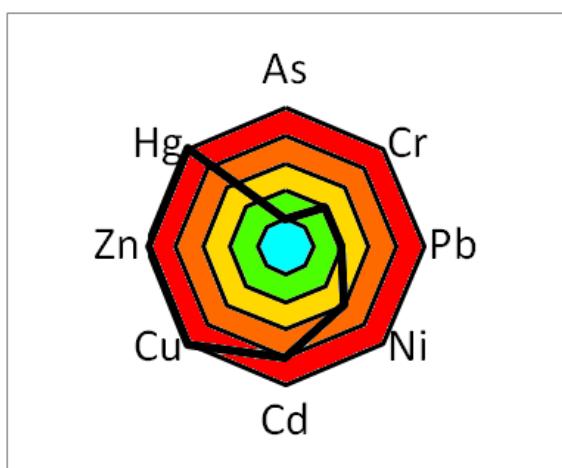

Figure 3.1: Mean of quantities of metals deposited in 2009 in precipitation. The colour codes are the same as those used in the maps. Arsenic (As) is close to the target indicating generally low deposition of this metal, whereas deposition of Mercury (Hg), Zinc (Zn) and Copper (Cu) is still high. For relative scale and colour coding see Table 3.1.

3.1.1 Metals (except mercury)

There is no evidence of any regional differences in metal deposition from the 2009 data set. This may be due to significant data gaps. There are some surprisingly high ranges in observations with some very high values. This has been also noted in previous years. An intercalibration exercise may be useful in interpreting some of the differences.

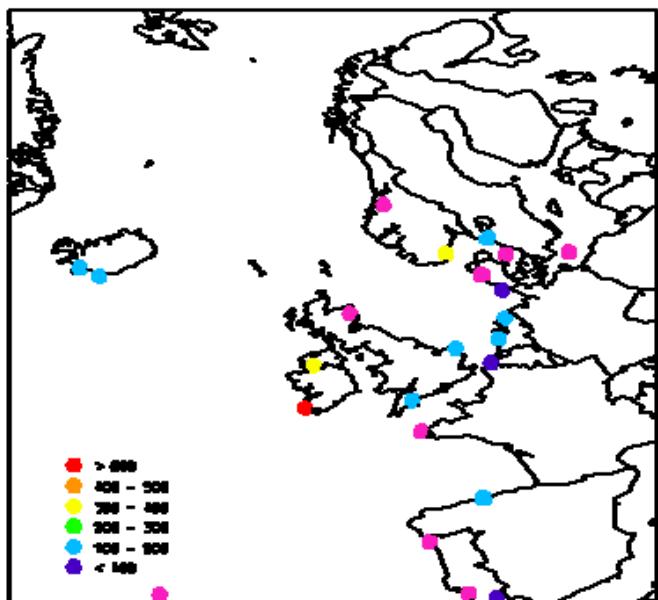

Figure 3.2: As depositions 2009 $\mu\text{g}/\text{m}^2 \text{ p.a.}$

Pink colour means no data reported for the station

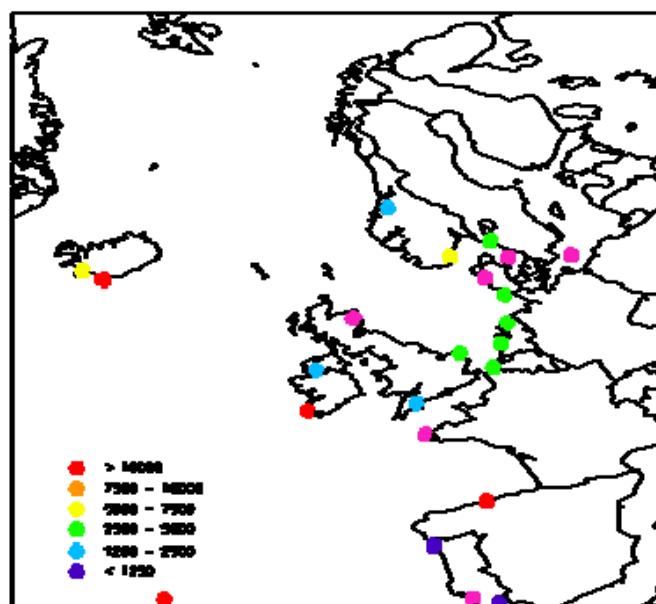

Figure 3.8: Zn depositions 2009, $\mu\text{g}/\text{m}^2 \text{ p.a.}$

Pink colour means no data reported for the station

3.1.2 Mercury

The good comparison in observed concentrations and depositions around the southern North Sea, from Norway around the coast to the United Kingdom, is repeated again in 2009, providing reassurance as to the quality of these measurements. Variations in total depositions may be caused by variations in rainfall amounts.

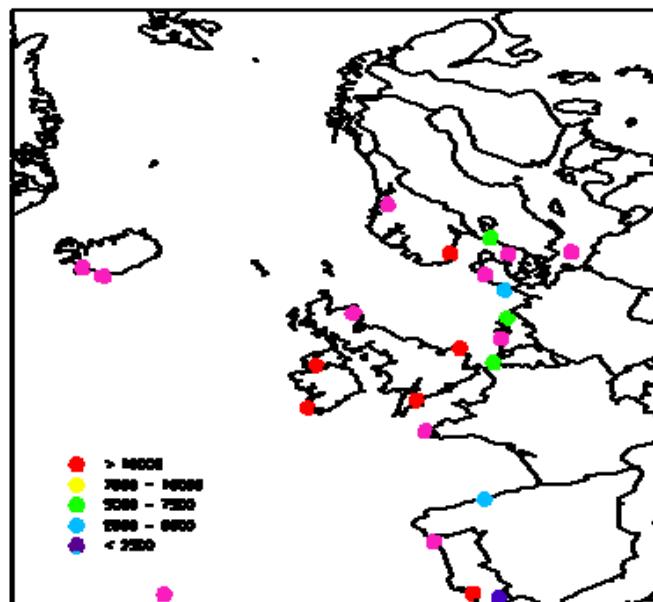

Figure 3.9: Mercury depositions 2009, ng/m² p.a.

Pink colour means no data reported for station

In addition to reporting the annual depositions, the monthly data can be presented. Future reports will also include a table of monthly means.

There are still some inconsistencies in the calculations, which could be partly eliminated by harmonizing the methodologies for EMEP and CAMP. An example is given below in Table 3.3 for Belgium.

Table 3.3: Monthly mean deposition of Mercury (ng/L) calculated for Belgium stations during 2009

	J	F	M	A	M	J	J	A	S	O	N	D
Values calculated by Belgium	2.782	4.349	6.769	10.61	13.84	14.27	16.92	21.33	6.883	5.362	4.840	4.261
Values calculated by EMEP	2.965	4.349	6.769	10.612	13.838	14.268	16.633	22.797	6.883	5.362	4.840	4.261
Values calculated by CAMP	3.101	4.308	6.769	10.612	13.832	14.276	16.468	25.888	6.928	5.392	4.832	4.454

3.2 Lindane

Lindane reporting is too low to make firm conclusions. Nevertheless, deposition continues to be relatively high around the North Sea and close to the Netherlands. This pollutant was used as a pesticide, especially in agriculture and in animal rearing. The temporal decrease of lindane deposition should follow its total banning in 2009, although this may take a number of years as it is a Persistent Organic Pollutant (POP). Future reports will also include a table of monthly means.

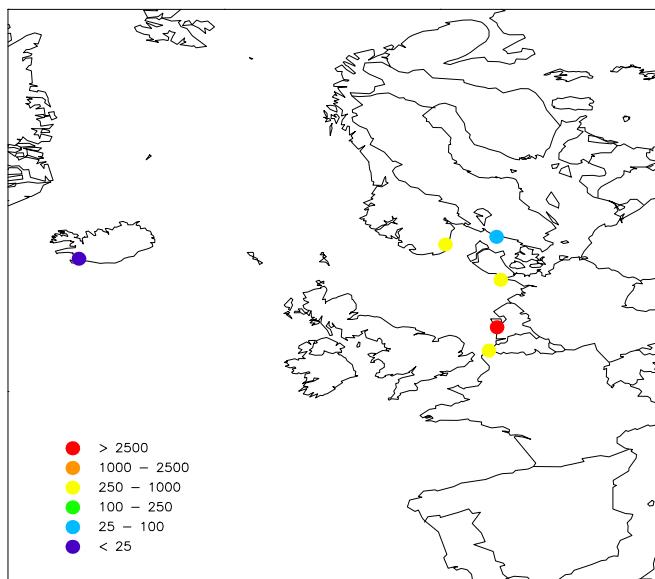

Figure 3.10: Lindane depositions 2009 ng/m^2

3.3 Nitrogen depositions in 2009

Nitrogen deposition in 2009 appears to be high around the North Sea. However, important regional data gaps limit the interpretation of the data. In view of the implementation of the Nitrate Directive, the Water Framework Directive and the Marine Strategy Framework Directive, the relative importance of atmospheric deposition with respect to runoff and riverine inputs should be monitored closely.

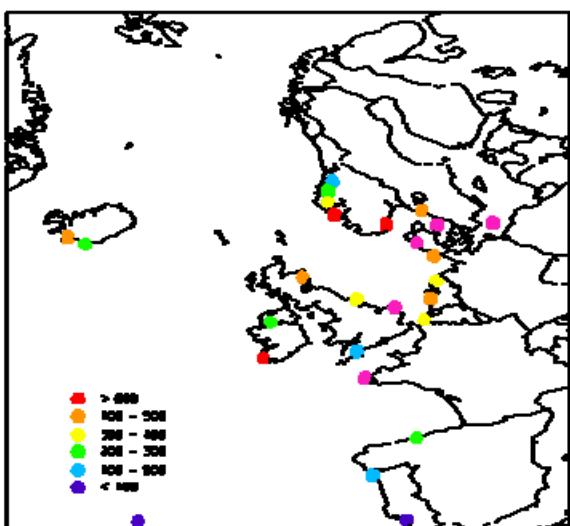

Figure 3.11: NH_4 depositions, $\text{mg N}/\text{m}^2 \text{ p.a.}$

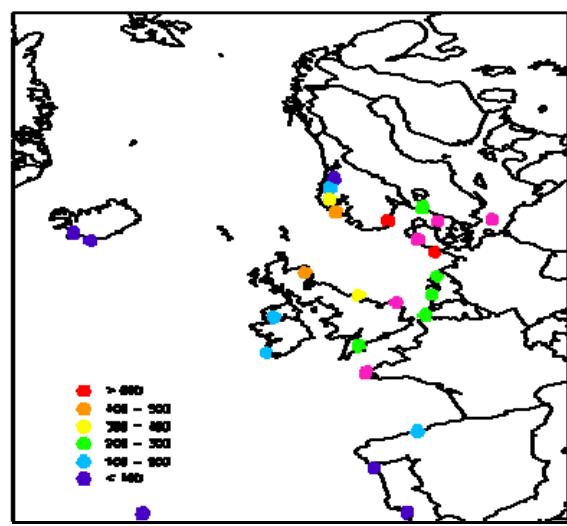

Figure 3.12: NO_3 depositions, $\text{mg N}/\text{m}^2 \text{ p.a.}$

Pink colour means no data reported for the station

4. Temporal Patterns and Trends

This section explores ways to present temporal patterns in the OSPAR CAMP data. It is proposed that periodic assessment reports are prepared to provide a comprehensive assessment of temporal trends, using statistical tools. Annual CAMP data reports could complement such regular assessments with simplified overviews of progression of atmospheric deposition for selected components of the CAMP Programme.

4.1 Temporal patterns in the OSPAR CAMP data for Norway

In the first example, the most complete national data set was used as an example to show whether there is any improvement in the monitored data with time, possibly as a response to more stringent environmental policies and criteria. If the situation improves as a result of environmental policies and practices, there should be a gradual change in colour from the red end of the scale towards the blue end of the scale. This is shown in Figure 4.1 for Norway.

Norway	2003	2004	2005	2006	2007	2008	2009
As	826	212	359	354	133	288	326
Cd	47	39	29	33	23	26	42

NH_4^+	478	424	519	439	444	413	395
NO_3^-	456	393	463	476	338	405	382

Figure 4.1: The mean for the deposition of each mandatory component has been calculated for each year from 2003-9 and colour coded. For the relative scales and colour coding see Table 3.1

There is no notable change in Cadmium (Cd), Zinc (Zn), Ammonium (NH_4^+) or Nitrate (NO_3^-) deposition over the 7 year period. However, Copper (Cu), Chrome (Cr) and Lead (Pb) deposition appear to have decreased over the 7 years, whereas Mercury (Hg) remains relatively high throughout this period. The deposition of Lindane appears to be very high in 2009 relative to the previous 6 years.

4.2 Temporal patterns in the OSPAR CAMP data for Lead, Cadmium, Mercury and Lindane

Figure 4.2a presents the calculated annual mean of deposition of lead, cadmium, mercury and lindane aggregated from reported CAMP stations for the OSPAR area. The presentation uses colour flags based on the relative scale and colour coding shown in the previous sections and repeated in Figure 4.2b for easy reference.

	2003	2004	2005	2006	2007	2008	2009
Pb ($\mu\text{g}/\text{m}^2$)	Yellow	Yellow	Yellow	Yellow	Yellow	Yellow	Green
Cd ($\mu\text{g}/\text{m}^2$)	Red	Red	Red	Red	Red	Red	Red
Hg (ng/m^2)	Red	Red	Red	Red	Red	Red	Red
Lindane (ng/m^2)	Yellow	Yellow	Yellow	Yellow	Yellow	Orange	Red

Figure 4.2 a: The mean for the deposition of lead has been calculated for each year from 2003-9

Cd $\mu\text{g}/\text{m}^2$	Pb $\mu\text{g}/\text{m}^2$	Hg $\mu\text{g}/\text{m}^2$	$\gamma\text{-HCH}$ ng/m^2
> 50	> 1250	> 10000	> 2500
40-50	1000-1250		1000-2500
30-40	750-1250	7500-10000	250-1000
20-30	500-750	5000-7500	100-250
10-20	250-500	2500-5000	25-100
< 10	< 250	< 2500	< 25

Figure 4.2 b: Relative scale and colour coding for Figure 4.2 a

The mean Lead deposition has been calculated for the various years. The importance of atmospheric transport of metals, including lead, gave rise in 1979 to the Convention on Long-range Transboundary Air Pollution and the 1998 Aarhus Protocol on Heavy Metals. The temporal trend (Fig 4.2a) indicates that the policy implementation has been effective in reducing atmospheric deposition of lead.

A comparison of the temporal pattern for Lead, Cadmium and Mercury shows that environmental policy has resulted in the decreased deposition of Lead in the OSPAR region during the last 7 years. However, this is not the case for Mercury and Cadmium. The deposition of these two Heavy Metals continues to be high.

The temporal trend for Lindane shows that environmental policy has not resulted in the decreased deposition of Lindane in the OSPAR region during the last 7 years. The deposition of Lindane continues to be high.

4.3 Temporal patterns with deposition values for Mercury

In the third example, the mean mercury deposition in precipitation has been calculated for the various years at Station NO0001R, the most complete data set.

The data set is shown below in table 4.1 and a bar chart with a (2 year moving average) trendline of the data in Figure 4.3.

NO0001R mercury	precip	2004	9.848
NO0001R mercury	precip	2005	8.854
NO0001R mercury	precip	2006	8.080
NO0001R mercury	precip	2007	6.297
NO0001R mercury	precip	2008	6.400
NO0001R mercury	precip	2009	9.436

Table 4.1: The mean annual deposition of mercury at station NO 001R has been calculated for each year from 2003-9. No colour coding is used in this example

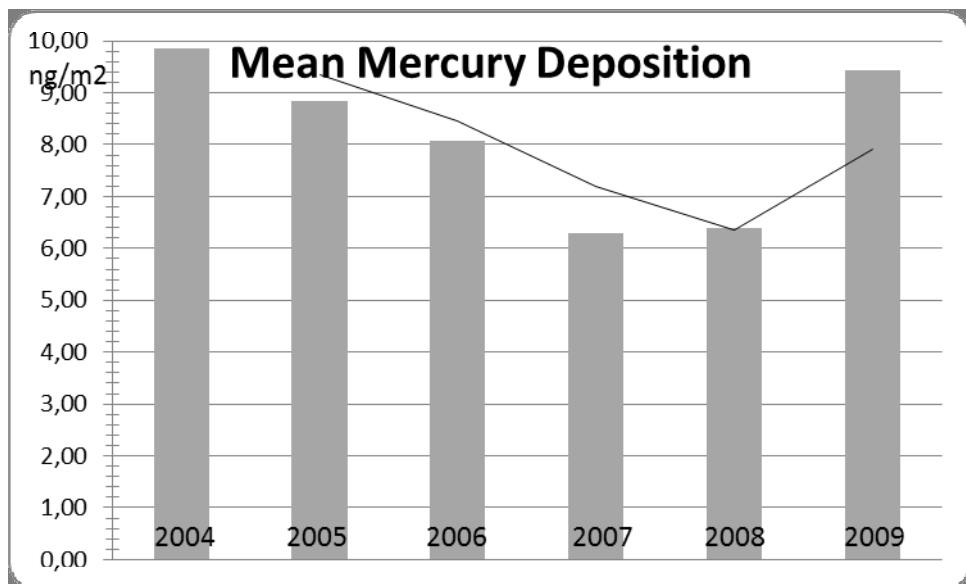

Figure 4.3: The mean annual deposition of mercury at station NO001R has been calculated for each year from 2004-9

For such charts to be useful, a long period (more than decadal) and a very complete data set are necessary. Although the trend seems to be decreasing from 2004, the mean for 2009 is high.

5 Main conclusions

There are several weaknesses in the CAMP monitoring network. These result in **problems of scale** and **geographical coverage**. Although the CAMP programme is now several years old, several of the CAMP stations do not strictly meet the requirements of the CAMP Principles (e.g. distance from coastline) and the North Sea remains the most intensely observed sub-region. Important gaps in the network concern Region III (Irish Sea) and Region IV (Bay of Biscay) and the far north-east. It would also be useful to consider including existing reference stations in Greenland and Faroe Islands and consider cooperation with Russia and their stations on the Kola Peninsula. **Spatial coverage may be too low to subdivide the data set into OSPAR subregions I-V.**

The decreasing trend of lead confirms that policies can result in significant environmental improvement. Lack of reporting hinders such clear statements with respect to mercury and Lindane, because **reporting of mandatory components is patchy**. There are systematic gaps in the reporting of some mandatory pollutants, such as **Lindane and mercury**. Monitoring results show high concentrations of mercury, especially for the Nordic countries, and therefore the importance of continued monitoring in that sub-region. Data on PCBs is also very limited and has been variable.

After 10 years, a **decadal statistical analysis of the database may be useful and timely**. The database could be useful to support the **implementation of the Water Framework Directive for transitional and coastal waters** as well as the **Marine Strategy Framework Directive** as there are many overlaps of the **Priority Substances, Contaminants** and the CAMP pollutants.

The database contains many non-mandatory data. **Access to the online database** could be enabled once the report has been adopted, allowing modellers to access and make use of the data, with appropriate caveats.

Harmonization of the calculations between EMEP and CAMP would also be useful. There may be natural environmental explanations for regional differences in some observations, such as natural biogenic or geothermal emissions, seasonality of rainfall, but monitoring may also contribute to discrepancies. Some are of such magnitude as to shed uncertainty. **Improvements in detection limits**, which in some cases are high, would also improve the quality and usefulness of observations. An **intercalibration exercise** could be implemented to improve the comparability of the data.

DATE	SIGN.	NO. OF PAGES 61	PRICE
TITLE Pollutant depositions in the OSPAR region of the North-East Atlantic in 2009		PROJECT LEADER Alice Newton	
		NILU PROJECT NO. O-97146	
AUTHOR(S) Alice Newton		CLASSIFICATION * CONTRACT REF. Andrea Weiss, OSPAR Secretariat	
REPORT PREPARED FOR OSPAR Commission New Court, 48 Carey Street, London WC2A 2JQ, United Kingdom			
ABSTRACT This report summarises the observations of the deposition of pollutants from the atmosphere to the OSPAR area during 2009. Priority is given to the metals arsenic, cadmium, chromium, copper, lead, mercury, nickel, and zinc, the organic pollutant lindane, and to oxidised and reduced forms of nitrogen. A number of voluntarily monitored pollutants are also reported by OSPAR countries. As well as providing estimates of deposition observed in 2009, the report summarises the temporal trends in deposition of lead.			
NORWEGIAN TITLE			
KEYWORDS North Sea, marine pollution, metals, nitrogen, OSPAR.

NILU is an independent, nonprofit institution established in 1969. Through its research NILU increases the understanding of climate change, of the composition of the atmosphere, of air quality and of hazardous substances. Based on its research, NILU markets integrated services and products within analysing, monitoring and consulting. NILU is concerned with increasing public awareness about climate change and environmental pollution.
