

Riverine Inputs and Direct Discharges to Convention Waters

OSPAR Contracting Parties' RID 2009 Data Report

OSPAR Convention

The Convention for the Protection of the Marine Environment of the North-East Atlantic (the “OSPAR Convention”) was opened for signature at the Ministerial Meeting of the former Oslo and Paris Commissions in Paris on 22 September 1992. The Convention entered into force on 25 March 1998. It has been ratified by Belgium, Denmark, Finland, France, Germany, Iceland, Ireland, Luxembourg, Netherlands, Norway, Portugal, Sweden, Switzerland and the United Kingdom and approved by the European Union and Spain.

Convention OSPAR

La Convention pour la protection du milieu marin de l'Atlantique du Nord-Est, dite Convention OSPAR, a été ouverte à la signature à la réunion ministérielle des anciennes Commissions d'Oslo et de Paris, à Paris le 22 septembre 1992. La Convention est entrée en vigueur le 25 mars 1998. La Convention a été ratifiée par l'Allemagne, la Belgique, le Danemark, la Finlande, la France, l'Irlande, l'Islande, le Luxembourg, la Norvège, les Pays-Bas, le Portugal, le Royaume-Uni de Grande Bretagne et d'Irlande du Nord, la Suède et la Suisse et approuvée par l'Union européenne et l'Espagne.

GLOSSARY

Catchment	The whole of an area having one common outlet for its drainage water. A catchment area could be subdivided into a monitored and unmonitored area, depending on where the monitoring point is located.
Cd	Cadmium
Cu	Copper
Direct discharges	A mass of a determinant discharged to the Maritime Area from point sources (sewage effluents, industrial effluents or other) per unit of time at a point on a coast or to an estuary downstream of the point at which the riverine estimate of inputs is made.
Heavy metals	Refers to the five metals whose direct discharges and riverine inputs were studied in this assessment namely: cadmium, copper, lead, mercury and zinc.
Hg	Mercury
LOD	Limit of Detection is, according to the definitions (IUPAC, IS/TR 13530), "the limit of detection (LOD) is, in broad terms, the smallest amount or concentration of an analyte in the test sample that can be reliably distinguished from zero".
LOQ	The limit of quantification (LOQ) is the smallest amount or concentration of analyte in the test sample which can be determined with a fixed precision, e.g. relative standard deviation $s_{rel} = 33,3\%$. This means in other words, that a substance can only be correctly qualified from LODs, while it only can be quantified from LOQs.
Main river	A river to be monitored at least once a month (12 datasets) every year in accordance with the objectives of the Comprehensive Study. Main rivers should be major load bearing rivers.
Monitored area	The catchment upstream of the river monitoring point.
Nutrients	Refers to the nutrients whose direct discharges and riverine inputs were examined in this assessment, namely total Nitrogen and total Phosphorus.
Pb	Lead
RID	Comprehensive Study of Riverine Inputs and Direct Discharges (reference number: 1998-5), as amended by ASMO 2005 (Annex 5 to the ASMO 2005 Summary Record, ASMO 05/13/1).
Riverine inputs	A mass of a determinant carried to the Maritime Area by a watercourse (natural river or man-made watercourse) per unit of time.
SPM	Suspended Particulate Matter
Total inputs	Sum of direct discharges and riverine inputs.
Total-N	Total Nitrogen
Total-P	Total Phosphorus
Tributary river	A river with separate catchment from a main river and with an outlet directly to the maritime area or to a main river downstream of a river monitoring point. A tributary river should be a minor load bearing river and can be sampled at a frequency determined by each Contracting Party.
Unmonitored area	Defined as any sub-catchment(s) located downstream the riverine monitoring points within catchments and any areas between catchments. The unmonitored areas may contribute to the losses/discharges of substances downstream of the monitoring point or directly to the sea (OSPAR Maritime Area).
Zn	Zinc

Introduction

The RID Centre 2009 data report gives the annual overview tables (*hereafter AA tables; Annex 2*) of the national RID reporting in 2009 carried out by Contracting Parties across the OSPAR Convention area (see Figure 1) under the Comprehensive Study on Riverine Inputs and Direct Discharges (agreement 1998-5, update 2005).¹

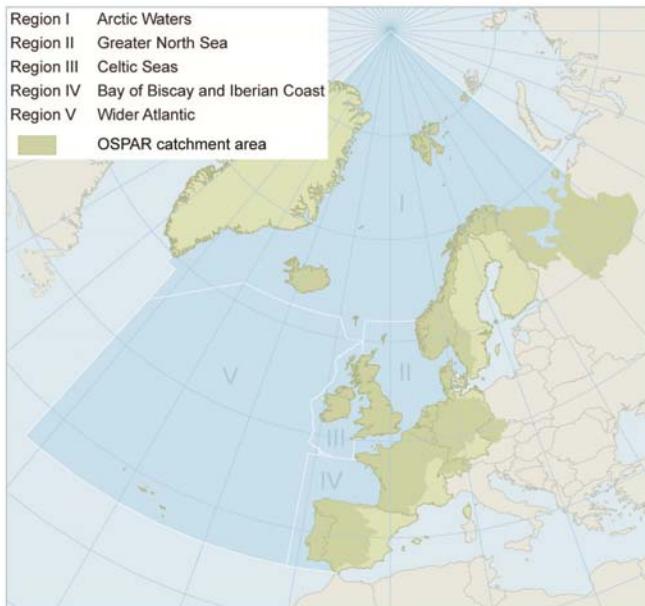

Figure 1: OSPAR maritime area, its five Regions and its catchment area. OSPAR Regions I: Arctic Waters, II: Greater North Sea, III: Celtic Seas, IV: Bay of Biscay and V: Wider Atlantic.

The RID Study forms one element within the wider Joint Assessment and Monitoring Programme of OSPAR. The purpose of the RID Study is to assess, as accurately as possible, all riverine inputs and direct discharges of selected pollutants to Convention waters on an annual basis. The RID Principles set out the monitoring regime to be employed for generating and reporting input data and to this end describes for example the relevant substances and river systems covered, sampling approach, locations and frequency, detection limits, calculation methodologies and quality assurance. Further details regarding the RID Principles are given in Annex 1.

For the years 2005, 2006 and 2007, comprehensive reports were developed based on the RID data. Here, challenges of the RID programme were presented; including uncertainties, knowledge gaps, lack of documentation on harmonised practises, approaches and methodologies amongst Contracting Parties (Skarbøvik and Borgvang 2007; Borgvang et al. 2008; Borgvang et al. 2009a). In 2009, a RID Database in Access format was prepared, and since then most of the work of the RID data centre (Bioforsk) has focused on the installation and functioning of this database. Thus, for the years 2008 and 2009, the reported data were presented without evaluations of the results (i.e. Skarbøvik et al. 2009 for the 2008 data; and this report for the 2009 data). This decision was further supported by the fact that a comprehensive assessment and trend analysis on the RID Programme data from 1990 – 2006 was developed in 2009 (Borgvang et al. 2009b, OSPAR publication 448/2009).

¹ At its Tenth Meeting (Lisbon, 1988) the Paris Commission¹ (PARCOM) adopted the Principles of the Comprehensive Study on Riverine Inputs (PARCOM 10/10/1, § 4.25 (e)). Such a comprehensive study was conducted for the first time in 1990. The RID Principles were reviewed in 1998 and 2005.

Country submission of RID data for 2009

Tables 1 and 2 provide an overview of the status of submitted information by Contracting Parties on which this report is based. In 2009, the submission of data and written reports did, in general, follow the agreed deadlines. All Contracting Parties except Denmark had a deadline of November 1st, whereas Denmark had a deadline of December 1st. As in 2008, all countries were asked to follow the new data format generated by the RID database, and several countries consequently delivered on the new format. Where data were delivered on other formats, Bioforsk transferred the data into the format of the database. All data were imported into the RID database and thereafter AA Tables 1a - 4b and national data tables 5a - 9 were exported from the database. These files were all sent to the respective Contracting Parties for validation.

Table 1. Overview of submitted information from Contracting Parties

Country	RID 2009 text report submitted	RID 2009 data submitted	RID 2009 data verified
Belgium	Yes	Yes	Yes
Denmark	Yes	Yes	Yes
France	Yes	Yes	Yes
Germany	Yes	Yes	Yes
Iceland	No	No	No
Ireland*	Yes	Yes	Yes
Netherlands	Yes	Yes	Yes
Norway	Yes	Yes	Yes
Portugal	Yes	Yes	Yes
Spain	Yes	Yes	Yes
Sweden	Yes	Yes	Yes
United Kingdom	Yes	Yes	Yes

* The report from Ireland was received too late to be taken into account in this report.

Table 2: Overview of information for 2009 on inputs to the OSPAR Maritime Area reported by Contracting Parties within the agreed deadline (green = data reported; NI = no information; NA = not applicable; red = no data submitted).

Country	Sewage effluents	Industrial effluents	Main rivers	Tributary rivers
Belgium	NA	NA		
Denmark				NI ¹
France	NI	NI		
Germany				
Iceland				
Ireland ²				
Netherlands				
Norway				
Portugal	NI	NI		NI
Spain				
Sweden				
UK				NI ¹

¹ Denmark and UK do not report inputs from tributary rivers separately. These inputs are included in the aggregated total riverine inputs.

² The report from Ireland was received too late to be taken into account in this report. It is however available in the compilation of national reports in the addendum.

Annex 1: Details about the RID Principles

Under the RID Principles, Contracting Parties should aim to monitor, on a regular basis, 90 % of the inputs of each selected pollutant.

The following determinants are to be monitored on a mandatory basis:

- Total Mercury (Hg)
- Total Cadmium (Cd)
- Total Copper (Cu)
- Total Zinc (Zn)
- Total Lead (Pb)
- Gamma-HCH (lindane)
- Ammonia, expressed as N
- Nitrates, expressed as N
- Orthophosphates, expressed as P
- Total N
- Total P
- Suspended particulate matter (SPM)
- Salinity (in saline waters)

The following determinants are recommended for monitoring on a voluntary basis:

- a. Hydrocarbons, in particular PAHs² and mineral oil³ (strongly recommended);
- b. PCBs (the following congeners: IUPAC Nos. 28, 52, 101, 118, 153, 138, 180);
- c. Other hazardous substances (particularly organohalogen compounds - in order to determine which organohalogen compounds should be included in future input studies)⁴.”

Sources for monitoring and reporting of direct discharges under the RID Principles include sewage effluents, industrial effluents and mariculture. As far as practicable, estimate inputs from unmonitored areas (including diffuse sources, and minor direct sources and rivers) should complement the percentage monitored to 100%.

Contracting Parties are requested to report their annual RID data together with an explanatory text report using the reporting format appended to the RID Principles. The results of annual RID data reporting are published by OSPAR each year.

RID data are to be reviewed periodically with the objective of determining temporal and long-term trends of contaminant concentrations and inputs as a basis for trend assessment. A first assessment of data collected under RID in 1990 – 2002 was carried out by the Environmental Assessment and Monitoring Committee (ASMO) in 2005 (publication number 2005/233); a second assessment for the period 1990 – 2006 was published by OSPAR in 2009 (publication number 2009/446) as contribution to the OSPAR Quality Status Report 2010 for the North-East Atlantic.

² These are as follows: phenanthrene, anthracene, fluoranthene, pyrene, benzo[a]anthracene, chrysene, benzo[a]pyrene, benzo[ghi]perylene, indeno[1,2,3-cd]pyrene.

³ Provided that a suitable method is available.

⁴ INPUT November 1995 agreed not to advocate routine monitoring of riverine inputs of pesticides convention-wide, but to address specific requests from SIME or DIFF* on a case by case basis. (* Secretariat note: DIFF was discontinued by OSPAR 2000. The work formerly undertaken by DIFF has been carried out by SPDS until 2004/2005 and HSC until 2009/2010, and, since then, by HASEC. SIME was discontinued by OSPAR 2010; its work is taken on by MIME).

¹ Denmark, Norway, Spain and UK also report inputs from aquaculture/fish farming. AA Table 2 is generated by the RID database as the sum of national data tables 5a and 5b. As inputs from aquaculture/fish farming are reported in other tables (5c or 5d) these inputs are not included in the totals presented here.

² Denmark reports inputs from scattered dwellings, stormwater overflows and fish farms as part of the totals in table 5c. As table 5c is not taken into account when generating AA Table 2 (cf. footnote 1), the totals presented here do not include these additional sources reported by Denmark.

³ Sweden reports inputs from stormwater overflows as part of the totals in table 5a. As table 5a is taken into account when generating AA Table 2 (cf. footnote 1), the totals presented here do also include this additional source reported by Sweden.

¹ Denmark and Sweden report inputs from unmonitored areas as part of tables 6a and 6b, respectively. As AA Table 3 is generated by the RID database as the sum of national data tables 6a and 6b, the totals presented here do also include inputs from unmonitored areas for Denmark and Sweden.

² France reports inputs from unmonitored areas as a separate table, and also includes these inputs in the total riverine inputs reported in national data table 6c. As table 6c is not taken into account when generating AA Table 3, the totals presented here do not include inputs from unmonitored areas reported by France.

³ Norway reports inputs from unmonitored areas as a separate table. These inputs are not included in the totals presented here.

Table 4a. Sum of Direct (Table 2) and Riverine (Table 3) Inputs to the Maritime area of the OSPAR Convention in 2009 by Country

See footnotes to Tables 2 and 3 for explanations to possible deviations from the reported data.

1) Catchment areas rounded off to the nearest hundred km²						
2) Population Rhine catchment per country requires further analysis						
3) Population Meuse catchment: rough estimates						
4) Estimated discharge at outlet: 2.300 m³/s * 24 h/d * 3600 s/h						
5) Estimated discharge at outlet: 325 03/s * 24 h/d * 3600 s/h
