

Overview of the Results of the Comprehensive Study on Riverine Inputs and Direct Discharges (RID) in 1999¹

**OSPAR Commission
2002**

¹ Extract of:

Data Report on the Comprehensive Study on Riverine Inputs and Direct Discharges (RID) in 1999, available on request from the Secretariat of the OSPAR Commission.

The Convention for the Protection of the Marine Environment of the North-East Atlantic (the “OSPAR Convention”) was opened for signature at the Ministerial Meeting of the former Oslo and Paris Commissions in Paris on 22 September 1992. The Convention entered into force on 25 March 1998. It has been ratified by Belgium, Denmark, Finland, France, Germany, Iceland, Ireland, Luxembourg, Netherlands, Norway, Portugal, Sweden, Switzerland and the United Kingdom and approved by the European Community and Spain.

La Convention pour la protection du milieu marin de l'Atlantique du Nord-Est, dite Convention OSPAR, a été ouverte à la signature à la réunion ministérielle des anciennes Commissions d'Oslo et de Paris, à Paris le 22 septembre 1992. La Convention est entrée en vigueur le 25 mars 1998. La Convention a été ratifiée par l'Allemagne, la Belgique, le Danemark, la Finlande, la France, l'Irlande, l'Islande, le Luxembourg, la Norvège, les Pays-Bas, le Portugal, le Royaume-Uni de Grande Bretagne et d'Irlande du Nord, la Suède et la Suisse et approuvée par la Communauté européenne et l'Espagne.

- 1 Introduction
- 2 Results of the 1999 Comprehensive Study
- 3 Presentation of the 1999 data

INTRODUCTION

Good input data for substances carried to the maritime area of the Paris Convention by rivers and direct discharges are essential in order to allow an assessment of the effectiveness of the Paris Commission's policies. They are equally essential for the interpretation of monitoring data such as those collected under the Joint Assessment and Monitoring Programme (JAMP) of the Oslo and Paris Commissions, which replaced the former Joint Monitoring Programme in 1995.

The riverine discharges to the landward ends of estuaries and direct discharges to estuaries and coastal waters are combined to give estimates of the gross input of each substance to the maritime area. It is not feasible at the present time to estimate how much of these inputs are retained within estuaries and near-shore areas and how much passes into the open sea. Several major research projects are in hand to address this issue. The riverine loads reported also represent the loads coming from the whole of the river catchment areas. In the case of international rivers, loads from upstream countries are ascribed to the most downstream countries. No attempt has been made to identify the sources of these loads or whether these loads are of natural or anthropogenic origins. Again research aimed at differentiating between anthropogenic and natural contributions to riverine loads is needed to put the information into perspective for management purposes. As regards inputs to sea areas the considerable maritime fluxes across sea boundaries have not been taken into account.

RESULTS OF THE 1999 COMPREHENSIVE STUDY

For the 1999 study, data sets on riverine inputs and direct discharges were provided by Germany, the Netherlands, Norway, Portugal, Sweden, Spain and the United Kingdom of Great Britain and Northern Ireland (UK). Only riverine inputs were reported by Belgium², Denmark (nutrients only) and Ireland³. France and Iceland⁴ did not provide input data for 1999.

The geographical coverage for 1999 was similar to the coverage in previous years, with similar gaps. The part of the maritime area best covered remains the OSPAR Region II, the Greater North Sea, and especially the main body of the North Sea, although even here gaps exist.

The reporting of mandatory and voluntary determinants (cf. Table 1b) in 1999 was similar to 1998. Not all Contracting Parties reported data for all mandatory parameters. All reporting Contracting Parties provided data on inputs of heavy metals with the exception of Denmark (no metal data for 1999) and Spain (mainly riverine inputs). There are a number of gaps as regards the reporting of data for inputs of γ -HCH and PCBs (Denmark, Ireland and Sweden for all inputs, Spain for most inputs, Norway for direct inputs) and suspended particulate matter (Denmark, Sweden for rivers). Some additional parameters, not summarised in the overview Tables 3 and 4, were reported by Norway (cf. Table 1b).

PRESENTATION OF THE 1999 DATA

Table 1a gives an overview of the information provided by Contracting Parties for 1999 and shows how the information was categorised:

- Direct inputs:
 - Sewage effluents
 - Industrial effluents

² Previously existing direct discharges no longer exist.

³ 1990 data for direct inputs are included, since the basis for the calculation remains unchanged.

⁴ Iceland stated in 1988 that it had no plans to monitor riverine inputs; however, Iceland announced in 1996 that it was setting up a monitoring plan which would also result in calculation of riverine inputs.

- Coastal areas: Data reported under "coastal areas" include discharges and run-off from coastal areas between rivers and also polder effluents. Depending on their nature, discharges from "coastal areas" are either counted under direct discharges or under riverine inputs.
- Riverine inputs:
 - Main rivers
 - Tributary rivers

Table 1b gives an overview of the determinands reported by Contracting Parties and shows where there are gaps in the reporting of mandatory determinands. Table 1b also indicates the precision of the estimate where the relevant information was provided by Contracting Parties. The last column of Table 1b informs on any additional determinands reported.

The data from Contracting Parties have in many cases⁵ been rounded to one significant number for data reported less than the unit in which they appear and to two significant numbers for data reported greater than one unit; the following examples illustrate this rounding convention:

Amount reported by Contracting Party	Figure reported in the tables
0,0011	0,001
0,011	0,01
0,11	0,1
1,11	1,1
11,1	11
111 and above	not rounded

Due to this procedure, there are sometimes slight differences between the calculated totals given in this report and those calculated by Contracting Parties.

Overviews of the input information by country and sea area are given in **Tables 2 to 4 a and b**. Table 2 gives an overview of direct inputs to OSPAR Convention Waters in 1998 and summarises the information which is set out in detail in Tables 5 on a country by country basis. Table 3 gives an overview of riverine inputs to OSPAR Convention waters in 1999 and summarises the information which is set out in detail in Tables 6 on a country by country basis. Table 4a summarises the information contained in Tables 2 and 3 and gives overall figures on inputs from land-based sources. Table 4b contains the same information as Table 4a but lists inputs by sea area. Please note that, due to major gaps in the reporting, no totals for the Convention area are given in Tables 2 to 4 a and b.

⁵ Secretariat note: Not all Contracting Parties wished to have their data rounded in accordance with this procedure.

**Table 1a. Information Received on Inputs to the Maritime Area
of the OSPAR Convention in 1999**

Country	Direct Discharges		Coastal Areas (2)	Riverine Inputs

+ = Information available

NI = No information

NA = Not applicable

(1) Tributary Rive - any tributary river flowing into (the estuary of) a main river, downstream from the sampling point;

- any minor river which was not deemed to be a main river.

(2) Coastal areas: - 'downstream areas' of main and tributary rivers and rivers not monitored;

- areas discharging to the maritime area which, however, are located outside the catchment area of a river.

(3) Included in data on riverine inputs ("tributary rivers")

(4) Included in data on direct inputs

(5) Iceland stated in 1988 that it had no plans to monitor riverine inputs; however, Iceland announced

in 1996 that it was setting up a monitoring plan which would also result in calculations of riverine inputs

(6) cf. category "run-off" (i.e. estimated values for diffuse contributions) in Table 6b. for Norway

(7) same 1990 data as in previous data reports.

+ : Data provided

R: Estimate given as a range

NI: No information

NA: Not applicable; riverine inputs > 90% total inputs

DL: Detection limit

(1) IUPAC Nos 28, 52, 101, 118, 153, 138, 180

(2) Suspended particulate matter

(3) 70 % of measurements above detection limit

(4) Less than 70 % of measurements above detection limit

(5) Includes 'run-off', i.e. estimated values for diffuse contributions.

(6) Iceland stated in 1988 that it had no plans to monitor riverine inputs; however, Iceland announced

in 1996 that it was setting up a monitoring plan which would also result in calculations of riverine inputs

(7) River Tejo only

(8) In England and Wales Total-P was not measured. To avoid anomalies, a value equal to the orthophosphate-P has been used.

(9) 1990 data since basis for calculation remained unchanged.
